“Markdown → Medium” Tool

Moving Markdown text into Medium can be a tedious process. Medium uses a bespoke What You See Is What You Get (WYSIWYG) editor that doesn't translate Markdown syntax. After manually reformatting my first Medium post, I decided there had to be a better way. With LLM assistance, I created **Markdown → Medium**, which I am offering for free.

What It Is

Markdown → Medium is a simple tool for converting Markdown files to a format that can be pasted directly into the Medium.com editor, requiring only minimal formatting changes there. It opens as a web page in a browser, but does not require an internet connection to function.

Requirements

The tool consists of three files; all three files must be saved in the same folder to function:

- `marked.min.js`
- `md-to-medium.html`
- `purify.min.js`

Markdown → Medium runs in a web browser:

- *Chrome* browsers work most reliably. I recommend *Brave* (`brew install --cask brave-browser`) or *Ungoogled Chromium* (`brew install --cask ungoogled-chromium`).
- *Safari* and *Firefox* both work in my testing. I currently use *Zen* (`brew install --cask zen`). If you have trouble using either Firefox or Safari, try a *Chrome-based* browser.

Interface

Workflow

1. Open **md-to-medium.html** in a web browser.
2. Copy the plaintext Markdown from your editor and paste it into the left Editor pane.
3. **Warning Badges** appear inline in the Preview pane to alert you when unsupported elements are changed (see “Limitations” below). **Warning Flags** in the bottom bar collect all Warning Badges in one place for reference.
4. Once you have reviewed any warnings and made any necessary changes, click the “**Copy for Medium**” button to copy the result to the clipboard.
5. Paste (Cmd/Ctrl+v) into Medium’s editor. Warning Badges do not carry over, but local image placeholders will show in the editor to make replacing them easier.

Limitations

The following features are not supported by the Medium editor:

- **Tables**—Tables are not supported; Medium will strip the table formatting. You will need to reformat tables as lists or replace them with images.
- **Nested list items and task items**—The Medium editor only supports simple lists with one level. All nested items will be promoted to top-level items, and task items will be changed to regular bullets.
- **Headers beyond H3**—Only H1, H2, and H3 are supported. Headers `####` + are collapsed to `###`.
- **Local images**—Images hosted locally will not upload automatically and will need to be added in the Medium editor. Images linked online will be retained.
- **Raw HTML markup**—Elements such as `<div>` and `<span>` are not supported and will be stripped.
- **Empty lines after blockquotes**—Medium's editor adds an extra empty line at the end of blockquotes. This is a quirk of the editor.

List of Markdown Elements and Support

- **Paragraphs** = Fully supported
- **Bold/Italic** `**text**` / `*text*` = Fully supported
- **Links** `[text](url)` = Fully supported
- **Headings H1–H3** `#`, `##`, `###` = Fully supported
- **Headings H4+** `####` + = Collapsed into H3 `###`
- **Unordered/Ordered Lists** `- Text` / `1. Text` = Fully supported (one level only)
- **Images, local** `![alt text](file/path.ext)` = Replaced with placeholder (alt text is preserved)
- **Images, remote** `![alt text](https://...)` = Fetched by Medium editor
- **Blockquotes** `> Text` = Fully supported
- **Inline Code/Code Blocks** = Fully supported
- **Horizontal Rules** `---` = Becomes a divider (blank line with three dots)
- **Tables** = Not supported by Medium editor; table formatting stripped

Important Notes

- Your content stays local; all processing is done on your device.
- The tool automatically sanitizes JavaScript, event handlers, and other potentially unsafe elements.
- The word count is based on the rendered text; it does not count the Markdown syntax.
- The reading time is based on an average reading speed of 265 words per minute.
